A BRIEF HISTORY OF AI

Today, artificial intelligence is present in many of the technologies we use every day in our computers, our mobile phones, our watches, our speakers... It is even present in our search engines and on social networks.

However, AI is an old scientific discipline, it was officially recognised as a field of research in 1956.

The historical timeline presented here highlights the main steps of AI developments from the first concept of a programmable machine by Ada Lovelace in 1837 to the most recent scientific advances in deep learning, applied to image recognition applications for example.

What are the main scientific milestones of AI?

Click on the image below to discover the details of each scientific milestone!
